SKILLS

Python High-Level Programming
- Object-Oriented Programming and data validation
- Applying graph algorithms in Python

C language
- Strong understanding of low-level programming and algorithm implementation.

Systems Programming
- C language
- Manual memory management
- File I/O and buffer state management

Algorithms & Data Structures
- Algorithm optimization and complexity analysis
- Graph traversal algorithms (DFS, BFS, Prim's)

Assets

Teamwork
Ability to work effectively in collaboration with developers, designers, and project stakeholders to achieve shared objectives and deliver successful outcomes.

Adaptability
Ability to quickly adapt to new technologies, tools, and changing requirements in software development projects.

Languages

Arabic
native language

English
Fluent

French
Good

Passionate AI & software engineering student driven by artificial intelligence and technological innovation. With strong foundations in Python and low-level programming, I am actively seeking to apply my problem-solving skills to real-world AI and Machine Learning initiatives.

Education

AI & Software Engineering Student

Since Oct. 2025 1337 Benguerir

- **The Curriculum:** Started with low-level programming (C) and Object-Oriented Programming (Python), now transitioning into Artificial Intelligence.
- **The Method:** 100% practical, project-based environment. Built entirely around solving complex problems and "learning how to learn" without traditional teachers.

High School Diploma

From 2020 to 2023 Lycée Ibn Soulaiman Roudani Taroudant

WRITING SAMPLES

Codexion (Multi-threadead simulation)

2026 1337 Benguerir

I've built a multithreaded simulation built in C, coordinating coders sharing limited resources with mutexes, condition variables, and FIFO or EDF scheduling to handle deadlocks, data races, and starvation.

Call Me Maybe (LLM function-calling engine)

2026 1337 Benguerir

I've have built an LLM function-calling engine in Python, using constrained decoding and token masking to generate structured JSON calls with validated function names and parameter types.

A-Maze-Ing (Python Maze generator)

From Feb. 2026 to May 2026 1337 Benguerir

Programmed a maze generator in Python, Implementing core graph traversal algorithms, specifically Depth-First Search (DFS) and Breadth-First Search (BFS), to handle generation and pathfinding.

Fly-in (Python Simulation & Visualization)

From May 2026 to July 2026 1337 Benguerir

- **Developed a modular Python simulation application** featuring custom data parsing, algorithmic modeling, and real-time visualization (parser.py, models.py, visualizer.py).
- **Engineered a scalable simulation engine** (simulation.py) capable of processing and traversing complex environmental maps with varying difficulty levels (ranging from basic linear paths to complex maze constraints).
- **Demonstrated strong problem-solving skills** by structuring the project with clean, object-oriented principles to handle dynamic data inputs and visual outputs.

So Long (2D Game)

From Nov. 2025 to Dec. 2025 1337 Benguerir

Developed a 2D game from scratch without a game engine, Event-driven programming and real time rendering. (C language)

Work Experience & Content created

Content Creation

Since Aug. 2025 Youtube & TikTok Benguerir

- Launched and run the "**YahCodes**" tech brand, producing content across YouTube and TikTok focused on software development, AI, and emerging technologies.
- Produced and edited educational videos to break down tech concepts.
- Built an engaged online community by consistently sharing practical tech insights.
